

Industry Recognizes Whitebox Security as the Driving Force in Data Access Governance

Year-over-year Growth of More than Double for Two Years Running

Tel Aviv, 17 February 2015: [Whitebox Security](#), a leader in the field of data access governance, has doubled its growth for two years running, adding customers in fields from automotive and banking to ecommerce and international trade. Global Blue, the largest tourism tax refund broker in Europe, and CNH Industrial, one of the world's largest commercial vehicles and agricultural equipment manufacturers, are among the latest additions.

"The market's demand for Whitebox Security's technology reinforces the critical role data access governance plays in circumventing internal and external threats," said Maor Goldberg, CEO of Whitebox Security. "The Sony incident is a prime example of inadequate data access governance. They should have been able to detect the unauthorized access in real-time before the hemorrhaging of terabytes of data."

Whitebox Security offers its customers two key products, Data Access Governance platform and the Crowd-Sourcing enabled business and data owners' platform, which allow companies to:

- Maintain complete data access governance, tracking, understanding, and analyzing who, what, when, where, and how their information is being accessed
- Stay in compliance with regulatory requirements, including Sarbanes-Oxley, HIPAA, PCI, ISO 27001/2, ISO 27799, to name just a few
- Identify and protect sensitive data against internal and external threats

Whitebox Security's Data Access Governance platform determines who can and has accessed structured, semistructured, and unstructured data. Whitebox Security delivers secure access to SharePoint®, Exchange, File servers, NAS, Active Directory, ERP, CRM, DropBox, Box, Office 365, and homegrown applications, no matter the location – cloud, hybrid or in-house.

Whitebox Security offers a patent-pending crowd-sourcing solution that allows IT and the compliance department to share secure data governance, compliance, and cybersecurity responsibilities with key personnel across the organization. It leverages the collective intelligence across the company to protect and manage the organization's unstructured data by eliciting employee input with intuitive, "non-technical" interfaces.

"We are immensely appreciative of our customers. Their recognition of the value we offer has led us to this milestone," concluded Goldberg. "This, however, is just the beginning. Criminals don't rest, they continue to innovate, and so will we."

About Whitebox Security

Whitebox Security helps organizations identify and protect sensitive data against internal and external threats. Its comprehensive solutions protect structured, unstructured, and semistructured data across the data center and the cloud. Leveraging crowd-power, Whitebox ensures quick deployment, implementation, and long-term maintenance with minimal training.

It lets organizations maintain complete secure data governance, tracking, understanding, and analyzing who, what, when, where, and how their information is being accessed while remaining in compliance with regulatory requirements, including Sarbanes-Oxley, HIPAA, PCI, ISO 27001/2, ISO 27799, among other regulations. Whitebox Security was founded in 2007. Customers include organizations in defense, financial services, high tech, retail, government, telecom, and travel.
